

ABSTRACT

A plant cover is formed from a flower pot cover and a base. The base has a plurality of expansion elements extending thereabout wherein each expansion element includes one or more areas of excess material shaped in the form of a pleat which extends generally from the lower end to near the upper end of the base. The base may be disposed over an outer peripheral surface of the flower pot cover such that an inner peripheral surface of the base is adjacent to and in contacting engagement with the outer peripheral surface of the flower pot cover. The expansion elements permit the base to expand and contract to both closely encompass and follow the contours of the flower pot cover disposed about the pot, thereby forming the plant cover.
